PROJECT KORIDOR

KWai

AI-Native Climate & Water Infrastructure

Turning stormwater, heat, cooling, underground space and data infrastructure into one adaptive urban syste

NVIDIA Inception Pitch Deck | Concept → Digital Twin → Pilot

ODYNEX AXIS LOGISTICS LLC

Project Koridor / Adaptive Futures

THE THESIS

Infrastructure should behave like a living system.

KWai connects water, energy, thermal management, mobility corridors and AI into one feedback loop.

WATER

Capture stormwater before it becom

THERMAL

Move waste heat where it createsse

COMPUTE

Use AI simulation and digital twins to

CORRIDOR

Make roads and underground corridors

Core proposition **A city can become its own adaptive infrastructure platform.**

THE PROBLEM

Today’s infrastructure is fragmented.

Flood control, data centers, roads, cooling, water management and emergency response are usually designed as separate systems.

EXTREME RAIN

Stormwater arrives faster than conventional drainage can absorb or safely convey.

HEAT LOAD

Dense computing creates concentrated thermal loads while cities face hotter conditions.

INFRASTRUCTURE COST

Major upgrades are expensive when every system requires its own trench, plant and

SLOW DECISIONS

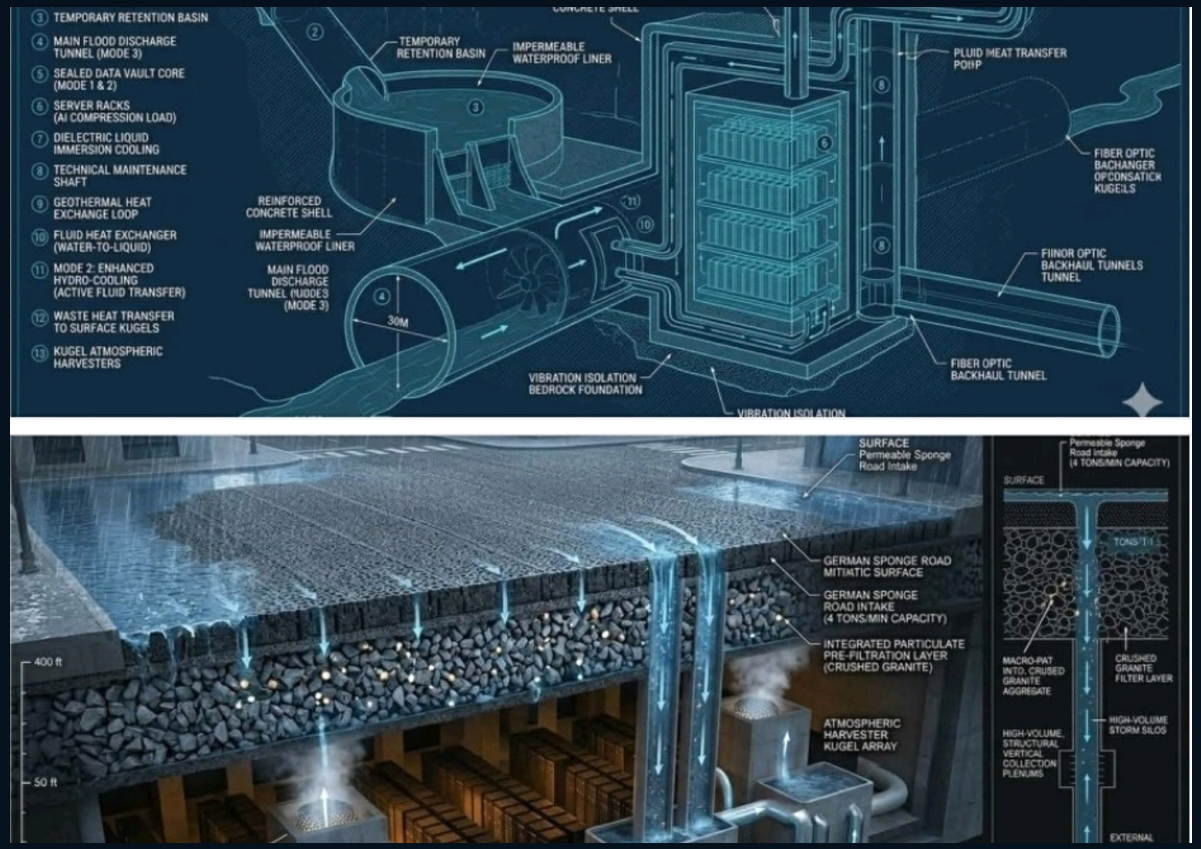

Cities often lack a shared digital model for testing interventions before capital is committed.

KWai reframes the problem: not “How do we add another system?” → “How do we make existing infrastructure do m

THE ARCHITECTURE

One corridor. Multiple functions. One intelligence layer.

The supplied concept image becomes the visual reference architecture for the KWai MVP.

01 SURFACE

Permeable / sponge-road layers route w

02 STORAGE

Temporary retention and controlled discharge.

03 HEAT

Exchange loops couple cooling and ther

04 COMPUTE

AI infrastructure provides the intelligence layer.

05 FIBER

Backhaul enables telemetry and distribu

06 DIGITAL TWIN

Simulate scenarios before physical deployment.

KWAI INTELLIGENCE LAYER

From physical infrastructure to an AI control plane.

The long-term product is not only the hardware—it is the continuously learning model of the corridor.

CITY / SITE DATA	Rainfall • sensors • terrain • traffic • power • thermal loads • asset condition
DIGITAL TWIN	3D/physics model • scenario engine • risk map • capacity model
AI / OPTIMIZATION	Forecasting • anomaly detection • routing • load balancing • maintenance prioritization
CONTROL + REPORTING	Operator dashboard • alerts • emergency modes • capital-planning outputs

Design principle: AI recommends and predicts; engineered safety systems remain deterministic, auditable and fail-safe.

WHY NVIDIA

KWai is a natural accelerated-computing and digital-twin use case

NVIDIA's current ecosystem supports the exact development path KWai needs: prototype → simulation → optimization → deployment.

ACCELERATED AI

Use GPU-accelerated workflows for forecasting

DIGITAL TWINS

Explore climate / infrastructure simulation, inte

STARTUP SCALE

Inception can provide developer tools, training, g.prefe

NVIDIA alignment is a development hypothesis to validate—not a claim of endorsement or partnership.

THE MVP

Build the smallest corridor that proves the system.

Start with a bounded pilot, instrument it, build the digital twin, then scale by corridor.

A

Instrumented corridor

Rainfall, water level, flow, temperature, power and asset sensors

B

Digital twin

A live scale model of terrain, drainage, thermal and infrastructure capacity

C

AI models

Forecast stormwater demand, thermal loads and asset anomalies

D

Decision dashboard

Operator view with safe operating modes and sc

MEASURE

Peak flow • retention • thermal load • energy • uptime

COMPARE

Baseline corridor vs. KWai scenario

LEARN

Use observed data to recalibrate the twin

PILOT GEOGRAPHY

Albany, Georgia as a living laboratory.

A Southwest Georgia demonstration can connect climate resilience, workforce development, public infrastructure and applied AI.

WHY ALBANY

- Flood and stormwater resilience
- Underutilized corridors / parcels
- Regional logistics significance
- Access to technical education
- Opportunity to demonstrate a replicable model

WHO BUILDS IT

- Odynex Axis Logistics
- Odynex Institute
- SOWEGA Asian Pacific Chamber & Foundation
- Local colleges / students
- Engineering + technology partners

WHAT SCALES

The pilot becomes a repeatable corridor package for munic

The objective is not to build one showcase. It is to prove a deployment pattern.

BUSINESS MODEL

A platform that can be deployed as infrastructure intelligence.

Revenue can layer software, engineering integration, monitoring and recurring optimization services.

1 Digital Twin Setup

Site model + data architecture + baseline simulation

2 KWai Platform

Recurring software / monitoring / analytics

3 Integration

Sensors, controls, fiber, thermal and stormwater systems

4 Optimization

Ongoing AI-assisted operations and capital planning

Long-term opportunity: a “Corridor-as-a-Service” model for municipalities, campuses, industrial parks and data-center ecosys

DEVELOPMENT ROADMAP

12 months from concept to measurable pilot.

The sequence is deliberately staged to reduce engineering and capital risk.

0–60 DAYS

System definition

Requirements • data inventory • site selection • safety architecture

2–4 MONTHS

Digital twin

Testbed • hybrid thermal model • sensor architecture

4–8 MONTHS

AI prototype

Forecasting • optimization • anomaly detection • validation

8–12 MONTHS

Field pilot

Installation • operator workflow • dashboard

Gate every phase with engineering review, field data and measurable go/no-go criteria.

THE ASK

Help us turn KWai from an architectural concept into a validated A

The immediate need is technical acceleration, simulation capacity and ecosystem guidance—not simply capital.

COMPUTE

GPU/cloud access for model development, simulation and inference.

EXPERTISE

Architecture review across AI, accelerated computing, simulation and deployment.

SOFTWARE

Identify the NVIDIA stack best suited for digital twins, AI and physics-informed

ECOSYSTEM

Technical introductions, pilot partners and pathways to scale.

Desired outcome **A reproducible NVIDIA-powered reference architecture for AI-native climate infrastru**

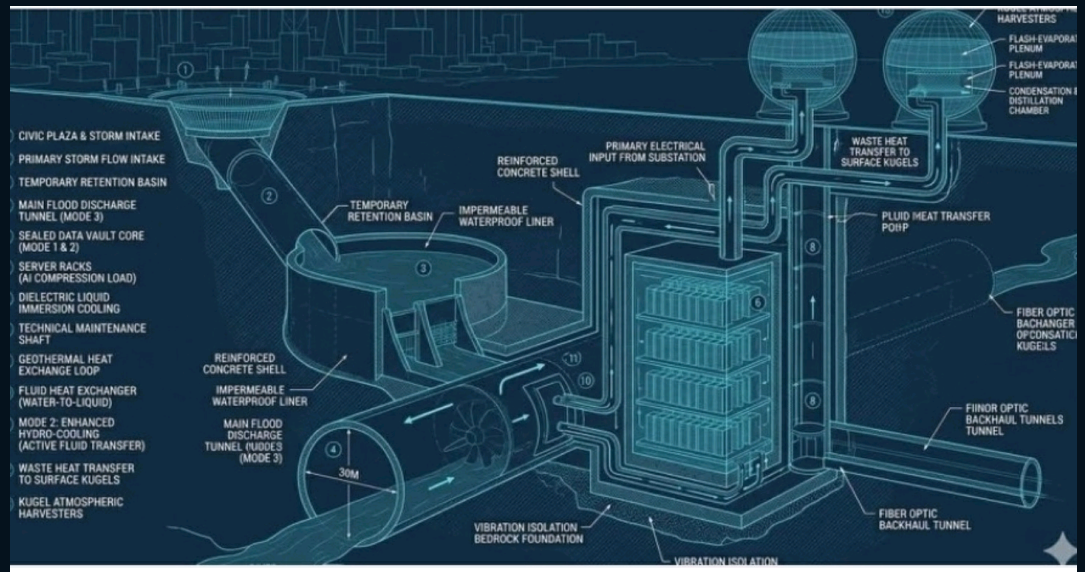

PROJECT KORIDOR

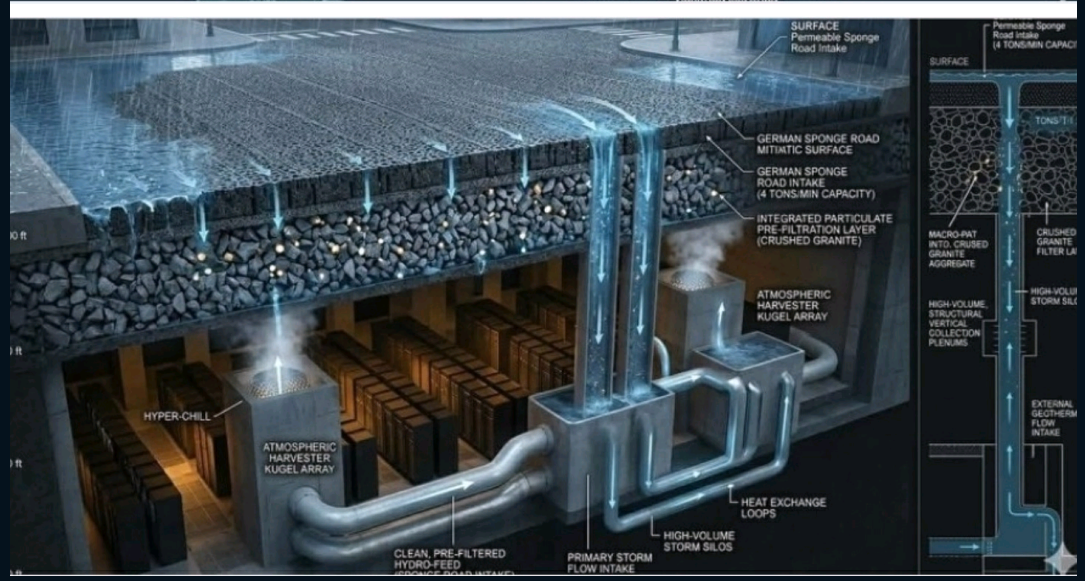

KWai

Infrastructure that can sense.
Intelligence that can adapt.
Corridors that can regenerate.
